Load IX

One operating record for every load

From contract and dispatch to weight evidence, reconciliation and invoice preparation.

System overview · Demo meeting

Fragmented tools break the operating story

When commercial rules, live execution and finance evidence live apart, every handoff creates another version of the truth.

Commercial intent

Routes, rates, quantities and tolerances need to remain connected to the work they govern.

Operational proof

Assignments, milestones, weights, documents and exceptions need one current operational record.

Financial confidence

Revenue, cost and invoice preparation should start from approved trip facts—not reconstructed evidence.

Loadlx keeps one record from contract to cash

Rules are snapshotted into operational work, evidence follows the trip, and approved facts flow forward.

01

Contract

Route, rate and tolerance

02

Instruction

Demand and timing

03

Plan

Driver, truck and trailers

04

Execute

Milestones, weights and POD

05

Reconcile

Quantity and exceptions

06

Prepare

Profitability and invoice batch

One tenant-scoped audit trail

Each role sees the work that matters

A shared record does not mean a shared screen. LoadIx presents the same facts through purpose-built workspaces.

Controllers

Plan and assign trips, move work through legal states, monitor the live board and resolve exceptions.

Drivers

Use a touch-first PWA for next actions, weights, location updates and camera-friendly document capture—even with intermittent connectivity.

Finance & management

Review reconciliation, charges, costs, estimated profitability, reports and invoice-preparation batches.

Exceptions surface before billing

LoadIx keeps operational state, quantity evidence and review context together, so issues remain visible and explainable.

See the state

The live operations board groups active trips by stage, exposes freshness and supports delayed or exception-only views.

Trust the quantity

Route-specific weighing, explicit quantity sources and snapshotted tolerance rules make reconciliation reproducible.

Resolve with context

Reasoned reviews and overrides preserve the actor, time and decision trail instead of hiding the exception.

Control is part of every workflow

The system protects the record at the moment work happens—not as a clean-up exercise after the fact.

Tenant-scoped access, server-side permissions and explicit support boundaries

Optimistic concurrency prevents stale edits from silently overwriting newer decisions.

Idempotent commands, immutable events and reasoned overrides

Retries produce one business outcome; sensitive operational and financial actions remain traceable.

Finance starts with a trusted trip

Completed work moves forward only when its operational evidence and quantity outcome are ready for financial review.

1

Operational evidence

Reconciled quantity, required documents and immutable rate snapshot

2

Financial review

Revenue, explicit costs, tax treatment and estimated profitability

3

Approved output

Customer-grouped invoice batch with CSV/PDF handoff

Built for pilot operations

The demo sits on the same domain model, permissions and infrastructure boundaries intended for the pilot path.

Deployable

A modular monolith with a documented dedicated-server deployment path, database migrations and health checks.

Observable & recoverable

Structured telemetry, durable background work, reporting queues, backups and rollback guidance support pilot operation.

Integration-ready

Versioned APIs and events, object storage, notifications and an edge-device/weighbridge foundation preserve clear boundaries.

Deterministic synthetic data makes the demo repeatable without creating a separate fake product.

Now, let’s follow one load end-to-end

Watch how rules, evidence, exceptions and approvals remain connected as the load moves.

Contract → load instruction → trip → driver → reconciliation → finance

01 Create and activate the commercial agreement

02 Plan the customer load instruction

03 Generate, assign and dispatch a trip

04 Capture driver milestones, weights and POD

05 Review quantity outcome and exceptions

06 Approve profitability and invoice preparation
